

FROST-PROOFING

Prevent your pots from cracking

1: Always fill the pot with one-third of LECA or a comparable material to facilitate proper drainage of excess water.

2: During the winter months, you must remove the saucer and raise the pot on stones or pot feet to prevent water accumulation and ensure the drainage hole remains unobstructed.

3: If you remove the plants from the pot before frost sets in, be sure to empty the pot completely of soil.

Additionally, exercise caution to avoid knocking over the pots if they are placed outdoors during winter.
