

FROST-PROOFING

Avoid your pots bursting

1: Always fill the pot with 1/3 of LECA or similar material to ensure that excess water can drain away

2: Remove the saucer in the winter and elevate the pot on a couple of stones or pot feet so that water can drain, and the drainage hole is not at risk of getting blocked

3: Completely empty the pot of soil if you're removing the plants before the frost sets in

Remember, be extra careful not to bump into the pots if they are kept outside during winter.
